Multispectral flame detectors are a type of flame detection technology that combines multiple sensors operating at different wavelengths of light to detect the presence of flames more accurately and reliably than single-spectrum detectors. These detectors analyze various spectral bands, including ultraviolet (UV), infrared (IR), and sometimes visible light, to distinguish between flames and non-flame sources and reduce the likelihood of false alarms.

The global Multispectral Flame Detector market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
