A multitubular heat exchanger is a type of heat exchanger. A shell-and-tube heat exchanger consists of a thick cylindrical body (shell) and a number of thin tubes to increase the installation area, and heat is exchanged between the fluid flowing on the body side and the fluid on the tube side. Since the hot and cold fluids must not mix directly but only transfer heat, it is important that both fluids flow through a fixed wall separated by a metal or other material to ensure efficient heat transfer.

In actual use, there are various factors such as the temperature and pressure to be used, the nature of the fluid, and the location of installation, and there are a wide variety of applications. Typical examples of heat exchangers classified by structure are multitubular heat exchangers and plate heat exchangers.

The global Multitubular Heat Exchanger market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
