The global Municipal Water Supply and Drainage Pipeline Inspection Robot market size is predicted to grow from US\$ 945 million in 2025 to US\$ 2211 million in 2032; it is expected to grow at a CAGR of 13.2% from 2026 to 2032.

Pipe inspection robots are used to inspect municipal water and sewer pipelines for blockages, cracks, leaks, and other issues. These sewer inspection robots can navigate through the pipelines, providing operators with valuable data and images to make informed decisions about maintenance and repair.

Municipal Water Inspection faces the constant challenge of maintaining clean, safe drinking water while managing aging assets. Regular inspections are vital to identify and address problems before they escalate, safeguarding public health and ensuring an uninterrupted water supply. Besides inspection of existing assets, municipal bodies also require pre-commissioning surveys of the newly laid pipeline network to ascertain the quality of work done by the contractor. Besides, quality assessment, robotic inspections are also used to perform an intrusive inspection of the welding quality. As one of the fastest growing economies, development of modern public infrastructure including underground water and sewerage supply network is on rapid growth in India. Since most of this network is laid underground, any future maintenance activity that comes up due to some workmanship defects is very expensive. Such unnecessary expenditure can be avoided by proper/intrusive inspection of such assets before commissioning. Since most such assets are non-man entry pipes, manual intrusive inspection is not possible and hence robotic conditional assessment survey becomes a necessity. Further, maintenance activities involving sewer works often involve manual intervention causing unnecessary risk to human lives. Using robots to perform such tasks can save such risks o human lives and put an end to manual scavenging once and for all.
