According to this study, the global Mycobacterium Tuberculosis market size will reach US\$ 1124 million by 2031.

Mycobacterium tuberculosis, abbreviated as tuberculosis bacillus, is the pathogen of human tuberculosis. Mycobacterium tuberculosis diagnosis refers to the process of detecting and confirming whether the human body is infected with Mycobacterium tuberculosis through various medical and laboratory techniques. Mycobacterium tuberculosis is the main pathogen that causes tuberculosis. The accuracy and timeliness of diagnosis are crucial to the effective treatment and control of the spread of tuberculosis. Diagnostic methods include microbiology, molecular biology, immunology, imaging and other means. It is usually necessary to combine multiple methods for comprehensive diagnosis to improve accuracy and reliability.

my country's tuberculosis infection rate is 44.5%, ranking second in the world. Due to the lack of good diagnostic kits, the disease remains a major threat to my country's public health. High-risk groups that need priority screening include health care workers (HCWs), military personnel, the elderly, students, immigrants, close contacts with active or suspected tuberculosis, long-term care workers, people with weak immune function, prisoners and other people living in clusters.

The trend of the tuberculosis diagnosis industry in the future will increasingly rely on efficient and accurate detection technologies. With the advancement of molecular biology and genomics, rapid and accurate detection methods such as PCR-based molecular detection and high-throughput sequencing will become more popular. These technologies can not only shorten the diagnosis time, but also improve the sensitivity and specificity of the test. In addition, the application of artificial intelligence and

machine learning will promote the development of automated analysis and personalized medicine, making early diagnosis and precision treatment more feasible. Strengthening and global cooperation in the field of public health will also play a key role in the control and elimination of tuberculosis.
