Myelofibrosis targeted drugs are medications specifically designed to treat myelofibrosis, a rare and chronic bone marrow disorder characterized by the abnormal accumulation of fibrous tissue in the bone marrow. These targeted drugs aim to address the underlying causes of myelofibrosis, which include mutations in certain genes such as JAK2, CALR, and MPL, leading to overactive signaling pathways that contribute to the disease. One class of targeted drugs used in the treatment of myelofibrosis is JAK inhibitors, which work by blocking the activity of Janus kinase enzymes involved in the abnormal signaling pathways. By inhibiting these enzymes, JAK inhibitors help reduce the production of abnormal blood cells and alleviate symptoms such as enlarged spleen, anemia, and fatigue associated with myelofibrosis. Another targeted therapy for myelofibrosis includes drugs that target other specific molecular pathways implicated in the disease, such as inhibitors of the spleen tyrosine kinase (SYK) pathway or the PI3K/AKT/mTOR pathway. These drugs aim to interfere with the aberrant cellular processes driving myelofibrosis and may be used alone or in combination with JAK inhibitors or other therapies.

The global Myelofibrosis Targeted Drug market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
