Myoelectric hands are advanced prosthetic devices that use electrical signals generated by the user's muscles to control their movements. These prosthetics feature sensors that detect electromyographic (EMG) signals from the residual limb, which are then translated into movements such as gripping, pinching, and rotating. Myoelectric hands offer a high degree of functionality and dexterity, allowing users to perform a wide range of daily tasks with greater ease and precision compared to traditional prosthetics. They often include features like customizable grip patterns and adaptive control systems, making them a highly effective solution for individuals with upper limb amputations.

The global Myoelectric Hands market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
