Myoelectric upper limb prosthetics are advanced artificial limbs controlled by the electrical signals generated by the user's muscles. These prosthetic devices use sensors to detect electrical activity in the residual limb's muscles when the user attempts to move their hand or arm. The detected signals are then translated into movements of the prosthetic hand or arm, allowing for more natural and precise control compared to traditional prosthetics. Myoelectric prosthetics offer improved functionality and can significantly enhance the quality of life for individuals with upper limb amputations by enabling them to perform a wide range of daily activities more effectively.
