Myopia contact lenses are vision correction devices that directly adhere to the surface of the cornea of the eyeball to correct nearsightedness. By altering the refraction path of light, they enable light to focus accurately on the retina, thereby improving the vision of nearsighted individuals and allowing wearers to see distant objects clearly. Their working principle involves using the negative diopter of the lenses to counteract the refractive errors caused by an overly elongated eyeball or an excessively steep corneal curvature in nearsighted patients. Myopia contact lenses come in both clear and colored varieties, and they can also be categorized based on their water content (below 50%, 50% and above) and replacement frequency (daily disposable, monthly disposable, yearly disposable, etc.).
