The global N-(phosphonomethyl)glycine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

N-(phosphonomethyl)glycine (Glyphosate) is a non-selective herbicide, meaning an application will kill most plants. It does this by preventing the plants from making three amino acids (components of proteins and vitamins) that are required for growth. Glyphosate stops a specific enzyme, EPSP synthase. This enzyme is found only in plants and many bacteria. In this report, we only statistics glyphosate bulk drugs.
