The global N Type Silicon Carbide Ingots market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

N-type silicon carbide (SiC) ingots refer to large, single crystals of SiC that have been grown with intentional doping to create an excess of negatively charged carriers (electrons) within the material. The doping process involves introducing impurities, such as nitrogen (N), into the SiC crystal lattice during the growth stage. N-type SiC ingots are essential for the production of high-quality SiC substrates, which are then used as a base material for various electronic devices.
