Nitrogen (N₂) Separation Membrane Module is a device used to selectively separate nitrogen gas from a gas mixture. The principle behind N₂ separation membrane modules is based on the selective permeation of gases through the membrane material. Membranes used in these modules are typically made from polymers, ceramics, or composite materials, and they possess specific properties that enable them to preferentially allow certain gases to pass through while blocking others. In the case of N₂ separation, the membrane allows nitrogen molecules to permeate through while blocking other gases present in the feed gas stream.

The global N₂ Separation Membrane Module market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
