NAND flash memory is a non-volatile storage technology that retains data after power is removed. It is a commonly used storage solution in modern electronic devices, especially in devices that require high-density data storage and reuse, such as solid-state drives (SSD), USB flash drives, and memory cards.

The working principle of NAND flash memory chips is based on the concept of storing electric charge and can represent binary data. Each memory cell represents a bit of information, and data can be written or erased by controlling the voltage on the gate. This technology allows NAND flash memory to achieve fast read and write operations while having a low cost per bit of storage.
