The global Nano Alumina Slurry market size is predicted to grow from US\$ 584 million in 2025 to US\$ 871 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

Nano alumina slurry is a stable and dispersed functional slurry made mainly of nano-sized alumina particles as solid components, combined with water, alcohols, organic solvents, resins, dispersants, binders, pH regulators, rheological agents, and other functional additives. Its core characteristics are fine particle size, high specific surface area, and high dispersion stability requirements. It can be applied to downstream processes through coating, polishing, impregnation, filling, casting, spraying, printing, or forming. Nano alumina slurries typically include water-based nano alumina slurries, solvent based nano alumina slurries, resin based nano alumina slurries, nano alumina polishing slurries, semiconductor CMP nano alumina slurries, battery separator coated nano alumina slurries, electronic ceramic nano alumina slurries, and thermally conductive filled nano alumina slurries. They are widely used in semiconductor polishing, sapphire and SiC wafer processing, precision optical polishing, lithium battery separator ceramic coatings, electronic ceramics, thermal insulation materials, wear-resistant coatings, transparent hardening coatings, catalytic carriers, and high-performance composite materials. In 2025, global Nano Alumina Slurry production reached approximately 64.57 K MT, with an average global market price of around US\$ 9,250 per MT.

Nano alumina slurry belongs to high-performance inorganic nano dispersed materials, with demand mainly coming from fields such as lithium battery separator coating, semiconductor CMP, SiC and sapphire polishing, electronic ceramics, thermal conductive filling, precision coatings, and functional composite materials. Among them, battery separator coating and thermal conductive filling contribute significantly to sales, while high-purity nano alumina slurry for semiconductor CMP, precision polishing, and

electronic ceramics contributes significantly to unit price and profit. With the development of new energy vehicles, energy storage batteries, AI servers, power semiconductors Mini LED? The demand for advanced packaging, optical crystals, and high-end ceramics is increasing, and the market for nano alumina slurry still has strong growth potential. The product upgrade direction mainly focuses on narrower particle size distribution, lower metal impurities, lower content of large particles, higher solid content and low viscosity, more stable dispersion system, lower scratch CMP polishing performance, and higher coating uniformity. The future market opportunities mainly focus on semiconductor grade low defect nano alumina CMP slurry, SiC high removal rate low scratch polishing slurry, lithium battery high safety ceramic diaphragm coating slurry, highly dispersed nano alumina slurry for thermal insulation composite materials, high-purity low sodium nano alumina slurry for electronic ceramics, and water-based environmentally friendly high solid nano alumina slurry.
