Nanofibrous media have a low basis weight, high permeability and small pore size that make them appropriate for a wide range of filtration applications, particularly for smaller particles.

In contrast to electrostatic filter media, nanofibers' filtration efficiencies depend on the mechanical filtration mechanism and do not degrade with time.

Filters composed of nano-sized fibers have a 99.9% efficiency in inhibiting viruses and are quite comfortable in terms of use. The face masks have a thin non-woven fabric and contain a nanofiber coating of very low weight that completely fulfills user expectations with its flexible morphology and structure that easily passes moisture.

This report focus on Nano-Fiber Face Masks market.
