Abstracts

The global Nano Polishing Agent market size is predicted to grow from US$ 478 million in 2025 to US$ 779 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

In 2024, global sales of nano polishing agents reached 48,000 tons, with an average selling price of $9,500 per ton. Nano polishing agents are high-precision surface treatment materials composed primarily of nano-sized cerium oxide, aluminum oxide, silicon dioxide, or zirconium oxide abrasive particles dispersed in a liquid medium. They are widely used for surface polishing of semiconductor wafers, optical glass, display panels, sapphire substrates, and precision metals. Upstream raw materials primarily consist of rare earth oxides, ultrafine oxide powders, and dispersants. Representative suppliers include Ganzhou Rare Earth, Sumitomo Chemical, Cabot, and Merck. Downstream customers include wafer manufacturers, panel companies, and optical component manufacturers, with typical companies including TSMC, BOE, Corning, and Shin-Etsu Chemical. Leading industry companies have a single-line production capacity of approximately 3,000 tons per year, and global total capacity is approximately 50,000 tons per year. The industry's average gross profit margin remains between 28% and 35%. Future trends will focus on ultra-low defectivity formulations, environmentally friendly water-based systems, and solutions that meet the high-end demands of advanced process nodes and high-resolution optical applications.

The nano polishing agent market is experiencing rapid growth, driven primarily by the semiconductor process evolution to 5nm and below, the rise of high-precision display panels for OLED and Mini/Micro-LED displays, and the demand for extremely flat and low-defect surfaces in optical lenses and sapphire substrates. Since material particle size uniformity, polishing rate, and defect control directly determine product

performance, the market is shifting towards high-purity, controllable particle size, and environmentally friendly water-based systems. A stable supply of upstream rare earth resources and ultrafine oxide powders is a key link in the supply chain. While China holds a significant advantage in rare earth raw material supply, high-end dispersion processes and precise formulations remain the domain of Japanese, American, and European companies. Downstream demand is highly concentrated, and wafer fabs, panel manufacturers, and optical companies face lengthy supplier certification cycles, creating significant technical and market barriers. Overall market competition is becoming increasingly oligopolistic, with international players such as Cabot, Fujimi, and Merck leading in high-end applications. Chinese companies are accelerating R&D breakthroughs to increase domestic substitution rates. In the future, as demand for AI chips, automotive electronics, and AR/VR optical devices grows, the market size of nanopolishing agents is expected to continue to expand and may extend to higher value-added ultra-precision manufacturing links.
