Nanopositioning is a technique for moving, measuring and positioning a device or instrument to sub-micron accuracy. Nanopositioning systems are often used to move and position devices such as tools, probes, sensors or scanners. In each case, there is a requirement to move the device to a set position and hold its precise position for a long time, or to position, hold briefly and then reposition the device multiple times at high speed.

The global Nano Positioning Sensors market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
