The report requires updating with new data and is sent in 48 hours after order is placed.

Silicon-based negative electrodes or silicon-carbon negative electrodes, as the highest known lithium-embedded negative electrode materials, have become a new trend in the development of current lithium battery negative electrode materials. The use of nano-silica powder (particle size less than 150nm) to prepare lithium battery negative electrodes can not only effectively solve the volume expansion problem of silicon during the process of inserting and removing lithium, but also increases the affinity with the electrolyte, making the end product lithium battery with high capacity (can Reaching 4000mA/h) and having a large number of charge and discharge cycles. In the future, as new energy vehicles continue to upgrade their requirements for lithium batteries, the demand for nanosilica powder is expected to continue to grow.

The global Nano Silicon for Lithium Battery market size is projected to grow from US\$ 53.4 million in 2024 to US\$ 279 million in 2030; it is expected to grow at a CAGR of 31.7% from 2024 to 2030.
