Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Nano Therapy market.

Nanotherapy is a branch of nanomedicine that involves using nanoparticles to deliver a drug to a given target location in the body so as to treat the disease through a process known as targeting.

Much of the research in nanotherapy has been largely directed towards cancer therapy. One of the biggest issues with conventional methods is that as the drug product is distributed throughout the body, both healthy and unhealthy (cancerous cells) are affected, which in turn affects the effectiveness of cancer treatment. It is for this very reason that most cancer patients tend to be hesitant when it comes to chemotherapy. However, nanotherapy, which is also referred to as targeted therapy, offers to deliver the molecules to the affected cells in order to help treat the disease without causing

other negative effects to the healthy cells.
