Nano Titanium Dioxide for Lithium Batteries refers to nanoscale TiO₂ materials used in cathode coating, anode modification, separator coating and electrolyte interface regulation for lithium-ion batteries. The product is typically supplied as a white nanopowder or dispersion, featuring small particle size, high specific surface area, good chemical stability, strong thermal stability and favorable interfacial compatibility. Compared with conventional nano titanium dioxide, Nano Titanium Dioxide for Lithium Batteries is not a new chemical substance, but a dedicated grade optimized and quality-controlled for battery systems. It places greater emphasis on stable particle size distribution, low metal impurities, low moisture content, surface treatment compatibility, slurry dispersibility, electrochemical stability and batch-to-batch consistency, helping improve electrode cycle life, rate capability, safety and interfacial stability.

Its end-use applications mainly include new energy vehicles, energy storage, consumer electronics, light transportation and special equipment. Product value is primarily concentrated in low-impurity control, particle size distribution stability, surface modification capability, electrochemical compatibility and batch-to-batch consistency.
