## Abstracts

The global Nanocrystalline Common Mode Choke market size is predicted to grow from US$ 242 million in 2025 to US$ 337 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

Common mode chokes are chokes that use an inductor cored with high permeable material to filter outside interferences while passing current in an electrical circuit. A common-mode choke uses two coils wound on a single core to suppress interference and prevent signal pollution. CMCs cored with nanocrystalline material provide better efficiency, are better suited for higher currents with higher inductances with high frequency ripples, typical of energy applications.

Common Mode Chokes are used to protect power lines from Electromagnetic Interference (EMI) and Radio Frequency Interference (RFI) and to prevent electronic equipment from malfunctioning. Nanocrystalline is always the best choice due to its advantages in damping effect, losses, temperature stability, size/weight requirements, frequency range, current rating and inductance rating. Demand for nanocrystals is being driven by a combination of expanding applications, increased demand for clean, high-quality filters, compact filters, and wide frequency ranges, coupled with rising global standards.
