The global Nanocrystalline Common Mode Inductor Core market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Nanocrystalline common mode inductor core is a magnetic core material used in electronic devices, mainly used for manufacturing common mode inductors. A common mode inductor is an electronic component used to suppress common mode interference, commonly used in fields such as power filtering, communication equipment, and electromagnetic compatibility. Nanocrystalline magnetic cores are made of nanocrystalline alloys, which are a special metal material with nanoscale grain sizes. Compared to traditional crystal magnetic core materials, nanocrystalline magnetic cores have higher saturation magnetic induction strength, lower coercive force, and lower hysteresis loss. Nanocrystalline common mode inductor cores are widely used in electronic devices in fields such as common mode filters, EMI filters, power filters, etc. They can effectively suppress common mode interference, improve the anti-interference ability and performance stability of circuits.
