Nanocrystalline materials are a type of crystalline materials with a particle size ranging from 1 to 100 nanometers. Due to their special microstructure and size effect, nanocrystalline materials exhibit many unique properties in physical, chemical and mechanical properties, making them have broad application prospects in many fields. Inverter air conditioners control the temperature by adjusting the operating speed of the compressor to achieve efficient and energy-saving cooling and heating, and nanocrystalline materials play a key role in this. The low magnetic loss and high magnetic permeability characteristics of nanocrystalline materials enable them to be used in the motors and power electronic components of inverter air conditioners, which can significantly improve the energy efficiency of the system and reduce power consumption.
