The global Nanofiltration Systems and Membranes market size is predicted to grow from US\$ 577 million in 2025 to US\$ 750 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

Nanofiltration (NF) is a membrane filtration process that falls between ultrafiltration and reverse osmosis in terms of pore size and separation capabilities. NF membranes have smaller pores than microfiltration and ultrafiltration membranes but larger pores than reverse osmosis membranes. This intermediate pore size allows nanofiltration to separate ions, small molecules, and larger molecules based on size and charge. NF systems and membranes find applications in various industries where selective separation and concentration of solutes are required.
