Nanoimprint lithography can be defined as the use of a mold to define nanoscale deformation of a resist, which is then cured either by heat or UV application. Silicon molds are mainly used in the thermal nanoimprint method. Patterns are drawn with an electron beam on a silicon substrate that has been coated with photosensitive resin. Dry etching is then used to make the patterns deeper. The manufacturing process, same as that of Quartz mold's, allows to form fine precision patterns.
