A nanoindentation tester is an instrument used to measure the mechanical properties of materials on a microscopic scale, typically at the nanometer level. This technique is beneficial for studying thin films, coatings, or small volumes of materials, where traditional methods may not be practical or feasible.

The development of nanoindentation testers is mainly driven by the progress of materials science and the demand for research on microscopic mechanical properties. With the widespread application of nanotechnology in many fields, such as semiconductors, biomedicine, energy, etc., it has become particularly important to accurately evaluate the mechanical properties of materials at the nanoscale. In the future, nanoindentation testers will develop towards higher precision, multifunctional integration and intelligence. These advances will further enhance the role of nanoindentation testers in new material research and development and quality control.
