The report requires updating with new data and is sent in 48 hours after order is placed.

Nanoparticle drug delivery systems are engineered technologies that use nanoparticles for the targeted delivery and controlled release of therapeutic agents. The modern form of a drug delivery system should minimize side-effects and reduce both dosage and dosage frequency. Recently, nanoparticles have aroused attention due to their potential application for effective drug delivery.

In this report, we only study liposomal/lipid nanoparticle drug delivery system.

LNPs became more widely known in late 2020, as some COVID-19 vaccines that use RNA vaccine technology coat the fragile mRNA strands with PEGylated lipid nanoparticles as their delivery vehicle (including both the Moderna and the Pfizer–BioNTech COVID-19 vaccines).

In this report, the COVID-19 vaccines with lipid nanoparticles technologies are not covered. The COVID-19 vaccines launch on the end of 2020. We expect revenue for COVID-19 vaccines with lipid nanoparticles technologies in 2021 to be approximately 37 billion USD.
