Nanopore sensors are devices that utilize nanometer-sized pores (nanopores) to detect and analyze molecules such as DNA, RNA, proteins, or other biomolecules. These sensors work by passing a molecule through the nanopore, which creates changes in the ionic current or other measurable signals across the pore. By analyzing these changes, the sensor can provide information about the size, shape, and chemical properties of the molecule being detected.

The global Nanopore Sensors market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
