The global Nanosecond Fiber Pulse Laser market size is predicted to grow from US$ 439 million in 2025 to US$ 661 million in 2031; it is expected to grow at a CAGR of 7.1% from 2025 to 2031.

Nanosecond fiber pulse laser is a laser that uses optical fiber as a gain medium and can produce high peak power laser output with a nanosecond pulse width. It usually uses optical fiber gain medium (such as erbium-doped fiber or neodymium-doped fiber) to generate short pulse lasers through pulse modulation technology. Due to the high efficiency, good thermal management ability and stable output of fiber lasers, their output pulses can be used for industrial applications such as precision machining, marking, micromachining, material processing, etc. Nanosecond fiber pulse lasers not only have high beam quality and small size, but also maintain excellent optical performance at high power output. Therefore, they are widely used in scientific research, industrial production and medical fields.
