Naphtha Catalyst: Naphtha catalyst refers to a substance that accelerates a chemical reaction, typically used in the refining of naphtha—a flammable hydrocarbon liquid. In the context of naphtha processing, catalysts are employed to convert naphtha into other valuable hydrocarbons, such as gasoline, olefins, and aromatics. Common catalysts include zeolites, metals like platinum or palladium, and acids, which help in the naphtha molecules into smaller ones or in selectively converting them into specific products. These catalysts are vital in the petrochemical industry for optimizing the refining process and improving yields.

The global Naphtha Catalyst market size is projected to grow from US\$ 303 million in 2024 to US\$ 361 million in 2030; it is expected to grow at a CAGR of 3.0% from 2024 to 2030.
