The global Naphthalene Acrylate market size is predicted to grow from US\$ 18.20 million in 2025 to US\$ 30.92 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Naphthyl acrylate and methacrylate monomers are functional polymerizable monomers containing both a naphthalene aromatic ring and an acrylate or methacrylate double bond. These monomers can be incorporated into polyacrylate or polymethacrylate backbones through radical polymerization, copolymerization, photopolymerization or controlled polymerization, providing aromatic content, fluorescence response, high refractive-index potential, higher glass-transition temperature, hydrophobicity, UV stability and rigidity. Key applications include fluorescent polymers, high-refractive-index optical materials, UV-curable coatings, functional films, photoresist and microfabrication materials, electronic display materials and specialty polymer research.

Naphthyl acrylates should be treated as a family of naphthalene-containing acrylate and methacrylate functional monomers. The value of this category comes from the combination of a naphthalene aromatic group and a polymerizable acrylate or methacrylate double bond. The naphthalene group provides aromatic rigidity, fluorescence response, high refractive-index potential, UV stability and hydrophobicity, while the polymerizable double bond enables radical polymerization, copolymerization, photopolymerization and functional polymer network formation.

From the supply perspective, this remains a niche functional monomer market with a limited number of publicly documented stable suppliers. Polysciences is the strongest non-China production-oriented supplier because its official materials identify the company as a specialty chemical manufacturer and its website lists 2-naphthyl methacrylate as an active product. BLD is the most complete China-based high-confidence production/supply candidate based on public product coverage across 1-NA,

2-NA, 1-NMA and 2-NMA.

Demand is mainly driven by fluorescent polymers, high-refractive-index optical materials, UV-stable coatings, functional films, electronic display materials, photoresist resin R&D and specialty polymer research. 2-Naphthyl methacrylate is more closely linked to high-refractive-index polymers, UV-resistant coatings, specialty resins and electronic/display materials. 1- and 2-naphthyl acrylates are more relevant to fluorescent monomers, copolymer research and materials screening. Naphthalene-based difunctional acrylates and methacrylates are more relevant to crosslinked networks and high-Tg optical materials. Future growth should come from high-index polymers, fluorescent functional materials, microfabrication resins, display materials and custom aromatic functional monomer development.
