Abstracts

The global Natural Cellulose Fibers market size is predicted to grow from US$ 41650 million in 2025 to US$ 61380 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

In 2024, global Natural Cellulose Fibers production reached approximately 2,010 kilotons, with an average global market price of around US$ 20 per kilogram. Natural Cellulose Fibers are plant-derived fibers composed primarily of cellulose, a natural polysaccharide that forms the structural component of plant cell walls. These fibers are obtained from various botanical sources such as seeds (e.g., cotton), bast or stem (e.g., flax, jute, hemp), leaves (e.g., sisal), and fruit husks (e.g., coir from coconut). Known for their renewability, biodegradability, and high tensile strength, natural cellulose fibers are widely used in textiles, paper production, ropes, composites, and other industrial applications. They offer advantages such as moisture absorption, breathability, and comfort, making them especially valuable in clothing and home furnishings, while also being considered environmentally friendly alternatives to synthetic fibers.

The key market drivers for Natural Cellulose Fibers include the rising global demand for sustainable and eco-friendly materials, as industries and consumers increasingly prioritize biodegradable and renewable alternatives to synthetic fibers. Growing environmental regulations and bans on single-use plastics are pushing manufacturers to adopt natural cellulose fibers in textiles, packaging, and composites. The expanding textile and apparel sector, especially in emerging economies, fuels demand for natural fibers like cotton, flax, and jute, while the construction, automotive, and paper industries are also boosting usage for their durability and lightweight properties. Additionally, advances in fiber processing technologies are improving the quality and versatility of these fibers, further enhancing their market appeal and broadening their application
