Natural sparkling mineral water, also known as carbonated mineral water, is water that contains dissolved carbon dioxide gas, which creates bubbles and gives the water a fizzy or effervescent quality. Unlike artificially carbonated water, where carbon dioxide is added, naturally sparkling mineral water obtains its carbonation through natural processes, typically by emerging from underground sources where it has absorbed carbon dioxide from the earth.

Natural sparkling mineral water often comes from underground mineral springs or wells. These sources can be rich in minerals and trace elements. The carbonation occurs naturally as water percolates through layers of rock and soil, dissolving minerals and

picking up carbon dioxide from the surrounding environment. Natural sparkling mineral water has a natural effervescence created by the release of carbon dioxide gas when the water reaches the surface. This effervescence can vary in intensity. It is commonly available in bottles, and some varieties may be packaged in specific types of glass or plastic to preserve the carbonation.

Natural sparkling mineral water may contain various minerals, such as calcium, magnesium, and bicarbonate ions, which contribute to its taste and potential health benefits. The mineral content and the presence of carbonation can impart a distinct taste to naturally carbonated water. Some people appreciate the perceived smoothness and unique flavor profile of certain mineral waters. Natural sparkling mineral waters are often enjoyed as a refreshing beverage on their own or as a mixer in various cocktails.
