The global Nautical Navigation Software market size is predicted to grow from US\$ 1743 million in 2025 to US\$ 2944 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Navigation navigation software is an application specially designed for nautical navigation activities. It uses modern information technology and multiple data sources to provide navigators with accurate positioning, navigation, route planning, information query and other functions to ensure safe and efficient navigation of ships at sea. By receiving satellite signals such as the Global Positioning System (GPS) and the Beidou Satellite Navigation System (BDS), the position, heading, speed and other information of the ship can be accurately determined. Combined with electronic charts, the position of the ship at sea is displayed in real time, providing sailors with intuitive navigation guidance to help them accurately grasp the navigation status of the ship and ensure that the ship travels along the scheduled route. It integrates a wealth of navigation information, such as port information, lighthouse information, navigation mark information, water depth information, weather forecast, sea ice conditions, etc. When the ship approaches a dangerous area, encounters bad weather or other emergencies, the software will issue early warning information in a timely manner to remind sailors to take appropriate measures to ensure navigation safety.

The application of AI technology in marine navigation software will become increasingly widespread. Through machine learning algorithms and big data analysis, the software can integrate data such as charts, weather, and ship sensors to calculate the best route in real time, and automatically adjust according to changes in sea conditions to improve navigation efficiency and safety. In addition to traditional application scenarios such as merchant ships and fishing boats, the application of marine navigation software in

yachts, scientific research ships, and maritime rescue is also expanding. The functional requirements of different user groups for software are also becoming increasingly diverse. For example, leisure yacht users may pay more attention to the entertainment function and convenience of navigation software, while scientific research ship users have higher requirements for data collection and analysis functions. In addition, with the increase in environmental awareness, marine navigation software may also play a greater role in energy conservation and emission reduction, such as helping ships reduce fuel consumption and greenhouse gas emissions by optimizing route planning and ship driving suggestions to meet the continuous improvement of environmental protection requirements for the shipping industry by relevant organizations such as the International Maritime Organization (IMO).
