The report requires updating with new data and is sent in 48 hours after order is placed.

The Naval Inertial Navigation System (INS) is a precision navigation device used by naval vessels to determine their position, velocity, and attitude without relying on external references such as radio signals or celestial bodies. It employs a combination of gyroscopes and accelerometers to measure changes in angular velocity and acceleration, respectively, which are then integrated over time to calculate the vessel's displacement and orientation. The INS is self-contained and operates independently of external factors, making it an essential component of submarine navigation and stealth operations where discretion is paramount. Additionally, it can be used in conjunction with other navigation systems, such as GPS or radar, to enhance accuracy and reliability.

The global Naval Inertial Navigation System market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
