Near-infrared DFB lasers are a specific type of laser that combines the near-infrared wavelength range with a DFB structure. The DFB laser design includes a periodic grating, usually a Bragg grating, to provide selective feedback to produce a single-mode laser output. Near-infrared wavelengths generally refer to light with wavelengths ranging from 700 nanometers to 1100 nanometers. Lasers of this near-infrared wavelength have important applications in medicine, biomedicine, optical communications, spectral analysis and other fields because of their ability to penetrate tissues and have good interactions with many biomolecules. Therefore, near-infrared DFB lasers are often used in applications in these fields that require highly controllable laser output.

The global Near-infrared DFB Laser market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
