The global Near-Infrared II (NIR-II) Fluorescence Imager market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A near-infrared II fluorescence imaging system is a device used for fluorescence imaging in the near-infrared II wavelength range (approximately 1000 to 1700 nanometers). It works by exciting samples with near-infrared light of specific wavelengths, causing the samples to emit fluorescence signals, which are then captured by an imaging system. This type of imaging system is commonly used in biomedical research, drug development, and materials science because it provides high-contrast images and has strong penetration capabilities for biological tissues.
