A Near Infrared (NIR) Microscope is a specialized optical microscope that utilizes the near infrared spectrum to visualize samples with high sensitivity and contrast. Near Infrared Microscope is designed to capture light with wavelengths just beyond the visible range, typically between 700 nanometers (nm) to 1700 nm. This spectral range allows for penetration of certain materials that are opaque to visible light, enabling the visualization of structures and details that are difficult to observe with conventional optical microscopes. NIR microscope is commonly used in various applications, such as materials analysis, biomedical imaging, and non-destructive testing.

The global Near Infrared Microscope market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
