The global Near Range Blind Spot LiDAR market size is predicted to grow from US\$ 460 million in 2025 to US\$ 1299 million in 2032; it is expected to grow at a CAGR of 16.0% from 2026 to 2032.

In 2025, global Near Range Blind Spot LiDAR production reached approximately 1,880 K Units, with an average global market price of around 250 US\$/Unit.

Near Range Blind Spot LiDAR is a compact, automotive-grade solid-state or hybrid solid-state sensor dedicated to detecting close-quarters blind zones around the vehicle, such as side and rear areas that cannot be fully covered by long-range LiDAR, cameras, or radar. It delivers high-resolution, real-time 3D perception at close distances, identifies nearby vehicles, pedestrians, cyclists, and obstacles, and supports safe lane changing, parking, low-speed maneuvering, and urban driving. Designed for wide field of view, high reliability, and low cost, it serves as a key supplementary perception device for eliminating sensing blind spots and improving driving safety.

The demand for near range blind spot LiDAR is mainly driven by the upgrading of automotive safety regulations and the rapid iteration of ADAS and autonomous driving systems, as its wide field of view and close-range high precision effectively compensate for the sensing blind spots of conventional sensors and provide essential safety redundancy. With continuous cost reduction from technological optimization and mass production, its application has expanded from high-end intelligent models to mainstream passenger vehicles and commercial vehicles, while growing demand from autonomous delivery vehicles and low-speed intelligent equipment further expands market space. Business opportunities focus on the localization and cost reduction of core components, the development of multi-sensor fusion solutions, and scenario-based product

customization, all of which will provide sustained growth momentum for the industry.
