The global Negative CO2 Cement market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Negative CO2 cement represents a greener alternative to regular cement. Cement manufacturers and companies utilize carbon negative cement in buildings due to less energy consumption to enhance the utility of raw materials such as limestone, clay, and marl. Negative CO2 cement has the ability to store atmospheric carbon in the fabric of the building. CO2 negative cement consumed more carbon dioxide than emitting. Furthermore, instead of limestone (CaCO_3) industries are using magnesium silicates (MgO_3Si) as alternative which come from olivine, talc, and serpentine. MgO_3Si have no carbon emission on heating. A lower temperature means that the amount of fossil fuels used to run the process is being decreased. Negative CO2 cement reduces carbon emissions of poured concrete from 800kg emitted per ton to 50kg absorbed per ton. According to think tank Chatham House, cement is the source of about 8% of the world's CO2 emissions.

United States market for Negative CO2 Cement is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Negative CO2 Cement is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
