## Abstracts

The global Negative Electrode Carbon Coating Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The negative electrode carbon coating material is mainly pitch, and the polyaromatic ring structure compound formed by cross-linking and solidification of pitch is similar to graphite material, with strong binding force, which improves the compatibility between the negative electrode material and the electrolyte, and prevents the co-embedding of solvents. Decomposition and exfoliation of graphite structure, with high reversible electrochemical capacity, improves the first-time Coulombic efficiency and cycle stability of anode materials. Asphalt is further divided into coal-based asphalt and petroleum-based asphalt. After graphitization, the petroleum-based asphalt has a higher gram capacity and lower pollution emissions. Therefore, the current negative electrode carbon coating is based on petroleum-based asphalt.

United States market for Negative Electrode Carbon Coating Material is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Negative Electrode Carbon Coating Material is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
