Negative ion ceramic balls are a product that combines negative ion technology and ceramic material characteristics. Specifically, negative ion ceramic balls are usually small spherical objects made by scientifically preparing high-activity negative ion ceramic composite powder with other silicate materials and firing them at high temperature. Due to the addition of highly active negative ion ceramic composite powder, tens of thousands of pairs of electrodes can be formed inside this ceramic ball. At the moment of contact with water or other media, electrolysis occurs and negative ions are released. Negative ions, also known as negative oxygen ions, refer to oxygen ions that have acquired excess electrons and are negatively charged. They are formed by oxygen molecules in the air combining with free electrons. Natural discharge (lightning) phenomena, photoelectric effects, fountains, waterfalls, etc. can ionize the surrounding air to form negative oxygen ions. The more negative ions there are, the better for health. The negative ions released by negative ion ceramic balls can undergo electrolysis with water to produce negatively charged hydroxide ions, thereby changing the properties of water and making it more suitable for human health needs.

The global Negative Ion Ceramic Balls market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
