The global Negative Temperature Coefficient (NTC) Thermistors market size is predicted to grow from US\$ 688 million in 2025 to US\$ 847 million in 2031; it is expected to grow at a CAGR of 3.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

An NTC thermistor is a ceramic semiconductor made with various metal oxides. Their electrical resistance decreases with increasing temperature. A typical temperature range for existing ceramic Negative Temperature Coefficient Thermistors is -80 degrees C to +300 degrees C. This resistance is processed by an electronic circuit to provide temperature measurement. The thermistor itself does not provide any control over heating elements, relays, etc. The thermistor is strictly a sensor and any electrical control would need to be implemented by the circuit utilizing the thermistor.

Conventional ceramic NTC thermistors have been employed in the marketplace for over 70 years; and dominate the thermistor market. The ceramic thermistors are comprised of a metal oxide mix annealed at high temperatures. Companies around the world have used this ceramic technology to produce billions of thermistors annually. Typically, NTC thermistor is the most popular and economic solution for various fields such as home appliance, automotive, telecommunication, computer, medical instruments, industrial sites, etc.

Global key players of negative temperature coefficient thermistor include Thinking Electronic, Shibaura, TDK, Semitec Corporation, Mitsubishi, etc. The top five players hold a share about 48%. China is the largest producer, holds a share around 49%,

followed by Japan and Europe, with share 13% and 11%, separately. The largest market is Asia-Pacific, holds a share about 72%, followed by North America and Europe, with around 14% and 12% market share respectively.
