## Abstracts

The global Nematode Control Pesticides market size is predicted to grow from US\$ 1535 million in 2025 to US\$ 1934 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

Nematodes have become an important class of plant pathogens

Nematodes are the most abundant multicellular animals on the earth, and nematodes exist wherever there is water on the earth. Among them, plant parasitic nematodes account for 10%, and they cause harm to plant growth through parasitism, which is one of the important factors that cause major economic losses in agriculture and forestry. In field diagnosis, soil nematode diseases are easily confused with element deficiency, root cancer, clubroot, etc., leading to misdiagnosis or untimely control. In addition, root wounds caused by nematode feeding provide opportunities for the occurrence of soil-borne diseases such as bacterial wilt, blight, root rot, damping-off, and canker, resulting in compound infections and further increasing the difficulty of prevention and control.
