The global Network Communication PCB market size is predicted to grow from US$ 498 million in 2025 to US$ 764 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Network communication PCBs are printed circuit boards designed specifically for communications equipment. As the "nerve center" of signal transmission, their core function is to enable high-frequency, high-speed data exchange. In 5G base stations, optical modules, switches, routers, and other equipment, network communication PCBs must meet stringent requirements such as low signal loss and high impedance control. For example, 5G base station PCBs must support frequency bands above 28 GHz, with signal loss kept below 20% to ensure base station coverage and data transmission stability. Technical barriers lie in material selection (such as the high-frequency substrate RO4350B), process precision (laser microvia technology), and multi-layer impedance control capabilities. These characteristics directly determine the performance ceiling of communications equipment. Global network communication PCB production is expected to reach 8 million square meters in 2024, with an average selling price of US$60 per square meter. Gross profit margins can reach 20%-40%.

United States market for Network Communication PCB is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Network Communication PCB is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Network Communication PCB is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
