Network Load Balancer is a network traffic management device or software-based appliance designed to distribute incoming traffic across multiple servers, applications, or network resources. It improves service availability, scalability, and response performance by monitoring connection status and directing requests according to rules such as load, server health, connection count, or application characteristics. Depending on architecture, products may support Layer 4 or Layer 7 load balancing, health checks, SSL/TLS processing, session persistence, traffic routing, and high-availability configurations. They are commonly deployed in data centers, enterprise networks, cloud environments, web services, and application delivery infrastructures. The product scope covers dedicated network load-balancing systems and appliances.

The industry chain begins upstream with processors, network interface controllers, switching chips, memory, storage, printed circuit boards, power supplies, thermal components, and software development technologies. Midstream manufacturers
