A network processor is an integrated circuit that is a programmable software device used as a network architecture component inside a network application domain. A network processor in a network is analogous to central processing unit in a computer or similar device. The replacement of analogous signals to packet data form in telecommunication has led to integrated circuits of network processors that handle data packets. Modern-day network processors have developed from simple designs to complex ICs with programmable software and a variety of operations and manipulation functions on the data packet. Network processors are employed in the manufacturing of routers, network switches, packet inspection, session controllers, firewall, transmitter devices, error detection and prevention devices and network control software. With today's web networking growing stronger than ever, network processors play a significant role in managing an overloaded network with abundant traffic and rapid growth rate. Network processors play a key role in packet inspection, encryption, monitoring, traffic management and queue management in a large network.

The Network Processor industry can be broken down into several segments, Lower Speed Network Processor, High Speed Network Processor, etc.

Across the world, the major players cover Intel, CISCO, Ericsson, Qualcomm, MACOM (Applied Micro Circuits), ARM, Broadcom, Cavium, Fortinet, Marvell, etc.

Global core network processor manufacturers include Intel, CISCO etc. The top 3 companies hold a share about 45%. Asia Pacific is the largest market, with a share about 70%, followed by North America and Europe with the share about 15% and 10%. In terms of product, high speed network processor is the largest segment, with a share about 80%. And in terms of application, the largest application is commercial applications, followed by home applications.
