The global Neuroactive Insecticides market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Neuroactive insecticides are chemical compounds that act on the nervous system of insects, disrupting their normal physiological functions and ultimately leading to their death. These insecticides are widely used in agriculture to control pest populations that can damage crops and reduce yields.

The global market for neuroactive insecticides is growing, driven by the increasing demand for crop protection solutions and the need for sustainable agriculture practices. The use of neuroactive insecticides is considered an effective and targeted method for controlling pests while minimizing the negative impact on the environment.

Key players in the neuroactive insecticides market include Syngenta, Bayer CropScience, BASF , among others. These companies are investing heavily in research and development to develop new and advanced neuroactive insecticides that are more effective and environmentally friendly.

However, concerns have been raised about the potential negative impact of neuroactive insecticides on non-target species, such as bees and other beneficial insects. As a result, some countries have imposed restrictions on the use of certain neuroactive insecticides, leading to a shift towards more sustainable and integrated pest management practices.

Overall, the neuroactive insecticides market is expected to continue growing in the coming years, driven by the increasing demand for sustainable crop protection solutions

and the need for environmentally friendly pest control practices.
