The neurological disease model chip is a biological simulation technology specifically used to simulate the pathogenesis and drug treatment effects of specific neurological diseases. This technology is usually implemented on a microfluidic chip or a microbial chip, and artificially cultured nerve cells or tissues are planted on the chip through tissue engineering and biotechnology means. Nervous disease model chips can be used to study a variety of neurological diseases, such as Parkinson's disease, Alzheimer's disease, epilepsy, stroke, etc. By simulating disease-related physiological and pathological processes as well as the effects of drugs on diseases, researchers can better understand the pathogenesis of neurological diseases and evaluate the efficacy and safety of potential treatments and drugs.

The global Neurological Disease Model Chip market size is projected to grow from US\$ 53.6 million in 2024 to US\$ 86.8 million in 2030; it is expected to grow at a CAGR of 8.4% from 2024 to 2030.
