The global NEV IGBT Modules Heatsink market size is predicted to grow from US\$ 287 million in 2025 to US\$ 615 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

NEV IGBT modules heatsink refers to a thermal management component specifically designed to dissipate the heat generated by IGBT (Insulated Gate Bipolar Transistor) modules used in New Energy Vehicles (NEVs). These heatsinks ensure the stable operation of power electronics such as inverters, DC-DC converters, and onboard chargers by effectively transferring heat away from the semiconductor junctions to maintain safe operating temperatures.

The value chain spans metals and alloys, seals/coatings, joining processes, TIM and coolant systems upstream; cold-plate/heatsink manufacturing and inspection midstream; and downstream power-module makers and Tier-1 e-drive system integrators that validate performance under automotive reliability regimes.

In 2025, global NEV IGBT modules heatsink production reached approximately 29 million units, with an average global market price is \$10 per unit.

In new energy vehicles (NEVs), IGBT modules are widely adopted as core power devices in the powertrain system. Their efficient operation relies heavily on effective thermal management, with the heatsink playing a critical role in ensuring the reliability, longevity, and overall performance of the IGBT module and the vehicle.

Currently, mainstream IGBT heatsink substrates are mainly categorized into flat-base and pin-fin types. Flat-base heatsinks feature smooth surfaces, typically made from high-

thermal-conductivity aluminum alloys or copper. These are attached to the IGBT module via press-fitting or bolts, ensuring close contact for efficient heat conduction. Characterized by simple structure and low manufacturing cost, flat-base heatsinks are suitable for low thermal density applications, such as hybrid vehicle power modules and on-board chargers (OBCs).

In contrast, pin-fin heatsinks employ densely arranged metal pins or columns to enhance heat exchange through liquid or air cooling. They are particularly suited for high-current, high heat-flux scenarios. Key power components such as motor control units (MCUs), motor controllers, and main inverter systems typically use pin-fin structures combined with cold plates to achieve high-performance thermal dissipation.

From an application standpoint, these heatsinks are widely used in motor controllers (MCUs), DC/AC inverters, OBC charging modules, and DC/DC converters in battery electric vehicles (BEVs) and plug-in hybrid electric vehicles (PHEVs). As NEVs evolve toward higher voltage and greater power output, IGBT modules are becoming increasingly integrated, imposing new demands on heatsinks for lightweight construction, compact design, and efficient thermal conductivity.

Looking ahead, with SiC devices gradually replacing traditional IGBTs, further improvements in thermal resistance control and structural compatibility are expected. This will drive the broader adoption of liquid cooling and hybrid cooling technologies in NEVs. As the demand for high-voltage, high-frequency, and high-power-density IGBT modules continues to rise, modular and integrated heatsink designs are becoming the trend, advancing toward lightweight, highly integrated structures with multi-channel flow paths.
