The new energy-saving DC arc furnace uses a controllable thyristor type static converter as the DC arc furnace power supply, which can convert the AC power supply to DC. By changing the conduction angle of the thyristor, the melting current can be

continuously and smoothly controlled, and the large current does not Exceeds the allowable value of the device. The use of a three-phase full-bridge rectifier circuit enables the rectifier transformer to have many simple winding designs and a solid and reliable structure. Since the adjustment of the conduction angle of the thyristor can only work when the next thyristor is turned on, there is a certain time lag. Therefore, a DC reactor DCL needs to be connected in series on the DC side, so that when the arc voltage drops instantaneously (short circuit), the dynamic short circuit current will not reach an unacceptable value instantaneously.
